Northwind Battery Analytics

Warranty-grade health reports for second-life EV battery packs

Used EV batteries are sold blind

About 400,000 EV packs will leave first-life vehicles in North America in 2027. Buyers of second-life packs (stationary storage integrators, remanufacturers, recyclers) price them on age and mileage because nobody can certify remaining capacity at scale.

A pack worth \$4,200 as storage is scrapped for \$900 of materials when its health is unknown.

What Northwind does

A 40-minute bench test using our fixture plus a model trained on 11,000 pack cycles produces a health certificate: remaining capacity, internal resistance drift, cell imbalance and a 24-month degradation forecast. The certificate is what the buyer underwrites against.

- Hardware fixture leased to dismantlers and auction yards
- Certificate priced per pack
- Buyers subscribe to the certified inventory feed

PAYING SITES

Nine dismantler and auction sites run our fixtures today. Two storage integrators (Helio Storage and Granite Grid) buy only Northwind-certified packs. Certified packs clear at a 31% premium over uncertified in the Copart second-life lane.

Business model

\$28 per certificate paid by the seller. Fixture lease \$900 per month per site. Buyer data subscription \$2,500 per month. Gross margin 74% blended; the fixture is built to order by a contract manufacturer in Guadalajara at \$6,100 per unit.

Average site certifies 240 packs a month. Payback on a fixture is under four months.

Market

The second-life battery market is projected at \$7.1B by 2030 (BloombergNEF, 2025). Our serviceable market is the 1,900 dismantlers, auction lanes and remanufacturers in the US and Canada that will handle EV packs, at an average of \$34k per site per year across certificates and leases.

Competition

OEM diagnostics (Tesla, GM) read packs from their own vehicles only and do not issue transferable certificates.
ReJoule and Voltaiq sell lab-grade analyzers at \$40k+ to labs, not to the yards where packs change hands.
Northwind is the only certificate that a buyer can underwrite against at the point of sale.

Team

Dana Whitfield, CEO. Led battery remanufacturing at Spiers New Technologies for six years; built the first second-life pack grading program in North America.

Tomasz Nowak, CTO. PhD in electrochemistry, University of Waterloo. Battery modelling lead at Nissan's Advanced Technology Center.

Luis Ortega, Head of Hardware. Fifteen years in test fixtures at National Instruments. Team of 11.

The raise

Raising **\$3M seed** to build 40 fixtures, hire field engineers in Texas and Ontario, and sign the first OEM remarketing partner.

Target: 40 sites and \$250k MRR by December 2027.
